Diagnosis: Apraxia

Identifying Information and Referral:

Tahlia Romack is a 3 year, 9 month-old girl initially evaluated by speech-language pathology pn

t2/2/13' She was referred by her pediatrician, Dr. John Webb. At that t[mr., mother was

concerned about her daughter's speech intelligibility; she noted a regressi,on over a 6 month period of time. Tahlia was diagnosed with a mild speech-language disordern affecting speech production and expressive language. She received weekly speech-language services from

t2/1,6/13 through the present.

Tahlia was also referred for an occupationaltherapy evaluation in october of 2013 by her pediatrician to rule out sensory processing disorder. Tahlia was evaluated iand reportedly

showed auditory, tactile, oral sensory, proprioceptive, and vestibular sensgry processing

problems as well as a low threshold for processing sensory information. Tahlia began week<ly

occupational therapy on tO/23/t3 through the present.

Parent Concern:

Mrs' Romack expressed continued concerns with Tahlia's speech intelligibility and expressive

language skills,

Background Information:

Background information was gathered per previous reports and written case history

information.

Pregnancy and Birth:

Mrs. Romack suffered from edema and migraines during her pregnancy

with Tahlia' She was treated with a morphine IV (for migraines) in each trinlester while the

baby's heart was monitored' Tahlia was the product of a full term pregnancy and was born via

assisted delivery after a 17 hour labor. Tahlia's birth weight was seven pounds, fourteen

ounces, There were no complications post- delivery or during the neona.tal period. The

newborn hearing screening was passed.

Medical:

Tahlia was diagnosed with a speech-language and sensory processing disorder at two years of age. She currently receives weekly speech-language and occupational therapy for 60 minutes each" There were no reported current health concerns, allergies or medications.

Developmental:

Developmental milestones were met on or ahead of time.

Family/Social:

Tahlia lived at home with her parents and baby brother. Family history was positive for ADHD, learning disabilities, neurological disease (migraines and seizures), and sensory needs.
